${\rm CS}652$ Smalltalk VM Operational Semantics

Terence Parr

April 4, 2016

Smalltalk	$\textbf{Context stack at} \leftarrow$
"Test testEvalReturnBlock"	Start send 0, 'value':
<pre>class T [f [x x := 1.^[x := 5]]] t := T new. t f value ←</pre>	$main[_,nil,_] \ f ext{-}block0[_,,]$
	Notes: no f on stack during eval of f -block0 but enclosing scope of f -block0 still points at f 's BlockContext.
${\bf Smalltalk}$	Context stack at \leftarrow
"Test testRemoteMethodCanSetMyLocal" class T [f [x self g:[x := 5 ←]] g: blk [blk value]] T new f	@store_local Δ =1, i =0:
I new I	$main[_,,]\;f[_,5,]\;g[_,f^{block_0},5]$
Smalltalk	Context stack at \leftarrow
"Test testRemoteReturn" class T [f [self g:[^99]] g:blk [blk value ←]] t t := T new. t f	Start send 0, 'value': $main[_,t,] \ f[_,,] \ g[_,f^{block_0},] \ f^{block_0}[_,,]$ After return in [^99] block: $main[_,t,99]$
	Notes: Despite eval in g , [^99] unrolls stack to $main$, the caller of f .

$T \bowtie x$	Resolve x in scope T
$o \in X$	o is instance of X
$\mathbf{v} \in \mathtt{STObject}$	a single object
$oldsymbol{l}_i \in exttt{STObject}$	the i^{th} argument or local variable object
$o_{class} \in \mathtt{STMetaClassObject}$	Metaclass (type) of object o
$o_{class_{class}} = o_{class}$	A metaclass object is its own type
$o_{superclass} \in \texttt{STMetaClassObject}$	Superclass (type) of object o
o_{field_i}	The i^{th} field of object o
$f_{literal_i}$	The i^{th} literal of method f
$f_s^{block_i} \in exttt{BlockDescriptor}$	The i^{th} block of method f associated with instance self= s
$f_s^{block_i}[extsf{-}, extsf{-}, extsf{-}] \in extsf{BlockContext}$	The i^{th} block of method f invoked with self= s
$f_s^{block_i}[_,_,_]^d \in exttt{BlockContext}$	The i^{th} block of method f invoked with self= s and having depth d counting from zero at the method block; e.g., $f [x [y]]$ has a method block at depth 0 with x and a nested block at depth 1 with y
$\gamma \in \texttt{MethodContext}^*$	Stack of method invocations growing to the right
$\delta \in \mathtt{STObject}^*$	Operand stack of objects growing to the right
S	The state of the VM system dictionary
(\mathbb{S},γ)	VM state is the system dictionary and a method invocation stack with zero or more elements
$(\mathbb{S}, \gamma) \Rightarrow (\mathbb{S}', \gamma')$	VM state transition
$(\mathbb{S}, \gamma) \Rightarrow^* (\mathbb{S}', \gamma')$	Zero-or-more state transitions
$f_s[ip, l_0,l_{n-1}, \delta]$	Method invocation context that derived from sending message f to receiver s (self); $f \in \texttt{MethodContext}; l_i$ is local variable or argument, indexed from 0 and arguments first; δ is the operand stack; f can also represent a nested code block not just a method
$f[ip, l_0, l_{n-1}, \delta]$	Same as previous but the receiver is unknown or irrelevant
$f[ip, _, _]$	A method invitation context with "don't care" for locals and operand stack

Figure 1: Smalltalk VM Bytecode Specification Notation

Bytecode Instruction	Transition	
initial state	$state_0 = (\mathbb{S}[\mathtt{Transcript}], \mathtt{main}_m[0, \epsilon, \epsilon])$

Figure 2: Smalltalk VM State Transition Rules

Smalltalk

```
"Test returnFromNestedCallViaBlock"

class Test [
   f [ self g: [^99←] ]
   g: blk [ self h: blk ]
   h: blk [ blk value ]
]
Test new f
```

Context stack at ←

Before return:

```
\begin{aligned} \mathit{main}[\_,,] \ \underbrace{f[\_,,] \ g[\_,f^{block_0},] \ h[\_,f^{block_0},] \ f}_{enclosing \ context} \ \Delta=1 \end{aligned} \underbrace{f[\_,,] \ g[\_,,99]}_{block_0}
```

After return:

$$main[-, , 99]$$

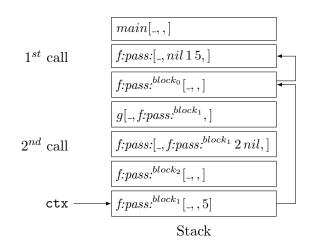

Notes: Despite eval in g, [^99] unrolls stack to main, the caller of f.

Smalltalk

"Test testSendBlockBackToSameMethodAndSetLocal" class T [f: blk pass: p [|x| p=1 ifTrue: [self g: [x:=5←]] ifFalse: [blk value]. ^x] g: blk [self f: blk pass: 2]] T new f: nil pass: 1

Context stack at \leftarrow

At store_local Δ =2,i=2:

Notes: The enclosing block of [x:=5] (called $f:pass:^{block_1}$) is [self g:[x:=5]] (called $f:pass:^{block_0}$). The enclosing block of $f:pass:^{block_0}$ is the first call, not the second call, to f:pass:
